

Jamaa Next Door

A platform to unify Muslims.

Designing a safer way to find
congregational prayer nearby.

5 Daily Prayers. 0 Nearby Mosques.

The problem began
with an experience,
not a technology.

**People were present, but
connection was missing.**

Arriving in Germany revealed a critical gap:
the absence of awareness, coordination,
and trust among nearby Muslims.

Breaking Down the Barriers to Connection.

A Short-Lived, Local Journey.

The product is deliberately ephemeral.
The Jama'ah ends automatically
when the time arrives.

From Reference to Reality.

Moving Beyond Generic AI

Deep Teal

Grounded / trustworthy

Off-White

Warm / approachable

Gold

Time / action

Sage

Privacy / calm

Human over Corporate:
Calm, local, and trustworthy.

Time-Based Hierarchy:
Contrast drives the next
immediate action.

Privacy as Architecture, Not an Afterthought.

Public Discovery (Approximate)

Approximate area/city location.

Scheduled time and prayer name.

Protected Information (Exact)

Exact street address.

Specific location photo.

Host identity.

Infrastructure: The server, not only the mobile screen, decides access. Powered by Supabase Row Level Security (RLS) and ownership-based private storage buckets.

Mobile-to-Backend Architecture.

Android UI

Routes, screens, and bottom sheets rendering state and forwarding user intent.

Controllers & Ports

Feature state holders, navigation contracts, and repository interfaces.

Implementations

Supabase Auth/Database, Storage, Realtime, and concrete Android APIs.

Dependencies point downward. Domain behavior strictly isolates concrete services from the user interface.

Maturing the AI-Assisted Workflow

Broad Requests

Moving away from treating AI output as a finished, unquestioned answer.

Controlled Specifications

Enforcing explicit constraints, maintaining smaller module ownership, observing on real devices, and repeating verification. Improving problem descriptions rather than accepting generic solutions.

A Framework for Safe Changes.

Proving it on Hardware.

The Stack: Standalone Android APK (successfully moved beyond the Expo Go development sandbox).

1. USB Debugging enabled.

2. ADB (Android Debug Bridge) deployment.

3. Live log monitoring.

4. Browser-assisted configuration for authentication routing.

Experiencing Jamaa Next Door.

[Insert 60-90 Second Walkthrough Video Here:
Magic Link → Profile → Discovery → Creation → Join]

Prototype Status and Future Horizon.

Working Capabilities.

Standalone APK installation.

Supabase Auth & Profile completion.

Jama'ah publication and automated lifecycle.

Requiring Validation.

Moderation policies and identity verification.

Broad user testing.

Production-level service configuration.

Arabic language implementation
(Requires deliberate Right-to-Left layout design, not just text translation).

From Isolation to Connection.

Personal motivation has transformed into a working, trust-aware, human-directed product.

Software is created for people. Trust, language, timing, and visual tone are not just design choices—they are the functionality.
