

Jamaa Next Door

A platform to unify Muslims. A privacy-first Android prototype helping Muslims in Germany discover nearby congregational prayer, create local jama'ahs, and build trusted community where no mosque is easily available.

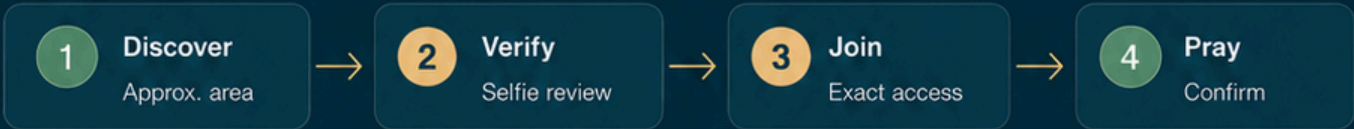

? Problem

Many Muslims without practical masjid access pray alone more often and miss the communal rhythm of worship. The core gap is safe, local worship access.

✓ Solution

Approved users can start or join a nearby jama'ah, see prayer times, chat only with participants, and receive exact location details after joining.

User Flow

Mobile App

Expo React Native with localized English, German, and Turkish screens for login, prayer times, discovery, creation, details, chat, notifications, and settings.

Backend

Supabase in an EU region with PostgreSQL, PostGIS distance queries, Realtime updates, private Storage buckets, and transactional server functions.

Admin Portal

Next.js dashboard for selfie review, reports, chat inspection, deletion requests, account controls, and immutable audit logs.

System Architecture

Privacy and Safety Model

Unverified users browse only privacy-safe approximate locations. Exact address, coordinates, and location photos are returned only through server-authorized access for approved users who joined that specific jama'ah. Chat is participant-only, plain text, rate-limited, and auditable by administrators.

- Approx. browsing
- Exact address gated
- Private selfies
- RLS functions
- Admin audit logs

Delivery Status

The monorepo scaffold includes the Android app, admin portal, shared domain logic, Supabase schema, RLS policies, seed data, and EAS configuration. Real Supabase, map, geocoding, and Expo push credentials are still pending deployment.
